

WHAT IS NUTRITION RESPONSE TESTING?

Nutrition Response testing is a non-invasive system of analyzing the body to determine the underlying stressors that can contribute to disease formation or non optimum health. Our clinically proven system may be quite different from any other healing practice that you may have experienced. We utilize case history and physical examinations prior to performing our analysis. The actual procedure is simple and direct, with the body providing vital information and feedback needed to help healing. We use the extraordinary properties of animal cells specific to electrical conduction to perform our analysis and to bring about healing and health changes. The body responds to the procedure reliably and consistently. This feedback can be so precise that it opens the door to a safe and lasting recover. For a visual demonstration please watch this short video above of the technique performed on man's best friend.

The Hows & Benefits of Testing

Through our analysis we are testing the body's neurological reflexes. These reflexes are the body's way of telling us what and how the nervous system is doing – as it is the nervous system's responsibility to regulate the body's functions for each and every organ.

The testing includes:

*organs *glands *joints *muscles

These reflexes are tested on the surface of the body and then the findings are analyzed.

How do we get the body's "reflex" information?

Energy flows exist between all parts and organs of the body. These flows can become disrupted for a variety of reasons. This disruption is easily discovered with our testing. As a Nutrition Response Testing practitioner and technician, we will do a full body scan to properly assess each of your pet's reflexes and assess which supplements can assist his/her body in healing. Once the underlying stress is corrected, this weak muscle response will no longer occur.

Following your pet's consultation you will be given the results in a way that you can understand containing:

- 1. a specific nutritional program for your pet to follow**
- 2. future diet recommendations for the least processed most healthful food specific to your pet's needs with a list of stressors to avoid.**

How soon will I see improvement?

Although every case is different, we often hear enthusiastic reports from patients in as little as 4-6 weeks. The fastest recoveries are often from those who have most closely adhered to their recommended nutritional program. In other more chronic issues it can take longer to see more than just initial results. Dr. Cutright along with your input will determine the reasonable time frame to allow your pet's body to heal, and if this isn't being met we can come up with an integrative plan to work with your veterinarian to include other integrative options.

Is it important to stick to the plan?

Generally chronic health problems do not suddenly develop overnight. They develop over a long period of time (often years) with improperly processed diets (which cause nutritional deficiencies and imbalances) and environmental influences. All of which have gotten your pet into their current health conditions. Therefore, the sooner and more thoroughly you implement your pet's program with the appropriate and gradual diet change, the sooner you will start to see results. While on our program, if you continue those same old habits and routines that contributed to your pet's current condition, your pet's condition may not improve as you hope. Total commitment to your pet's program is strongly urged.

What are my chances for recovery?

We must determine whether or not your pet is a "Nutrition Response Testing Case". If your pet is NOT a "Nutrition Response Testing Case" then it is unlikely that Nutrition Response testing will help. However, if they ARE a "Nutrition Response Testing Case", your pet's health has the potential to excel and maintain well into old age.
